## Meaning of list[-1] in Python

I have a piece of code here that is supposed to return the least common element in a list of elements, ordered by commonality: 

```
def getSingle(arr): from collections import Counter c = Counte
```

## [Difference between List, List>, List, List, and List](#)

The notation List> means "a list of something (but I'm not saying what)". Since the code in test works for any kind of object in the list, this works as a formal method parameter. Using a type parameter

## Wind Power Consulting

Exponent has led the wind energy consulting industry since the mid-1980s and remains one of the most established and experienced consulting firms providing

## Python: list of lists

The first, [:], is creating a slice (normally often used for getting just part of a list), which happens to contain the entire list, and thus is effectively a copy of the list. The second, list(), is using the actual

## List of wind power consulting companies

This is a list of notable wind power companies. Some wind industry associations, such as the Global

### [What is the difference between list and list \[1:\] in Python?](#)

By using a : colon in the list index, you are asking for a slice, which is always another list. In Python you can assign values to both an individual item in a list, and to a slice of the list.

### [What is the difference between list and list \[:\] in python?](#)

When reading, list is a reference to the original list, and list[:] shallow-copies the list. When assigning, list (re)binds the name and list[:] slice-assigns, replacing what was previously in the list.
